Question # 1:

Maner believes that cyber ethics issues are unique because they
did not exist before computing and would not have existed without
the invention of computing. He doesn't provide any arguments.

Question # 2:

Logical Malleability refers to the fact that computers are malleable
and can be made to preform a wide variety of tasks. He believes this is
significant because that means that computers can create "new possibilities
for human action" that may not be checked by laws or policies.

Question # 3:

Breys method has three levels: the Disclosure Level, the Theoretical Level,
and the Application Level. The disclosure level says that computer scientists
need to disclose the moral values that are programmed into their systems. The
theoretical level says that philosophers need to test their ethical theories against
the moral values that are programmed into the computer systems. Finally, the
application level says that these newly theorized and traditional ethical stantards
need to be applied to the computer systems.

Question # 4:

Buttericks advice tells me to narrow margins, reduce line spacing, and use smaller
in order to make an easier to read document that also fits more text.
